

**3/20/24**

**Scribe:** Margaret Muhich

**Notes:**

- Decide if we need to cut anything out and figure out what's the plan
- Planned features:
  - Mood input with song recommendations
  - Recommendation history
  - Connects to Spotify account
  - Returns Spotify query with recommended songs
  - Can view seen Spotify statistics
  -
- Implement suggestions
  - Can implement other people's processes
  - Situational suggestions: User inputs specific mood/situation
  - Randomize feature
  -
- We can get mood from the user, but how can we get more value from the user?
  - Separate page where they can share their songs and show it to their friends/share it over social media - make an image or something people can post
  - People add to playlists themselves
- We've set up weekly meetings on Fridays and sending messages on Slack
- User stories
  - We have a basic idea of who's assigned to what,
  - Stories for a lot of things, but we don't need to make it super concise- authentication can be one user story, we don't need to specify things like docker-compose and css-formatting, we can also remove the user input
  - We don't need to list subtasks as their own stories, we need to modify/remove the unnecessary ones.
- Why does Login have so many people assigned? - It was from the lab's instructions, we need to figure out who's specifically working on that one.

**Minutes:** 6pm-6:15
